

SUPERO

CONSUMER DESIGN HANDOFF

High-fidelity interface direction and implementation contract for Claude Design.

DESIGN ONLY / APP CODE UNCHANGED

Version 1.0 / 28 Aug 2026

PREMIUM. FOCUSED. TRUSTWORTHY.

TRAIN WITH INTENT. SEE PROGRESS WITHOUT DIGGING.

A complete consumer-ready direction for the workout loop, progress, Coach, programme, settings, and onboarding.

FROM DESIGN BOARD TO CONSUMER PRODUCT

The original editorial energy stays. The experience becomes clearer, warmer, and more trustworthy.

PRODUCT PROMISE

STRONG ENOUGH FOR THE GYM. CALM ENOUGH FOR EVERY DAY.

Supero should feel focused under effort and quietly useful between sessions. It motivates through clarity and proof, not noise.

NOW

What matters in this moment?

NEXT

What is the one best action?

PROOF

What evidence shows progress?

CORE AUDIENCE

PEOPLE WHO TRAIN CONSISTENTLY.

They care about progress, time, and confidence. They do not want to manage a spreadsheet while lifting.

Design outcome: every screen reads in under three seconds.

FOUR RULES GOVERN EVERY SCREEN

These rules resolve visual decisions before subjective taste does.

01 One action wins

Every state has one obvious high-emphasis action. Secondary choices stay visibly quieter.

02 Calm under effort

Controls stay stable, large, and thumb-reachable while the athlete is lifting or recovering.

03 Proof before decoration

Progress views lead with a finding, name the comparison, and let the chart support it.

04 Trust is visible

Coach edits are previewed and reversible. Health and privacy states explain scope and storage.

A PREMIUM PALETTE WITH STRICT SEMANTICS

Warm neutrals carry the product. Blue is action. Lime is outcome. Red is caution.

BUILD PRIMITIVES BEFORE SCREENS

A small, consistent component set makes the one-file app easier to implement and maintain.

PRIMARY ACTION

Full-width only for screen progression or completion.

Continue

STATUS PILL

Display-only. Blue=current, lime=done, red=caution.

Complete

Current

METRIC FIELD

Large tabular value with attached 44 px increment controls.

155 x 8

ACTION DOCK

Keyboard and safe-area aware. One primary action.

Log set

TODAY: ONE CLEAR REASON TO OPEN THE APP

The next useful action leads. Weekly proof follows without turning the home screen into a dashboard.

CONSUMER REFERENCE

1

Editorial, not oversized

Keep the bold voice while preserving room for the workout card above the fold.

2

One primary action

Start workout is the only high-emphasis action in the hero.

3

Outcome has meaning

Lime communicates on-track status and completed sessions only.

4

Weekly proof stays light

Show one completion signal and one trend; link to deeper progress.

ACCEPTANCE

At 390 px and the smallest supported iPhone width, the workout name, focus, and Start workout action remain visible without horizontal scrolling.

WORKOUT OVERVIEW: BUILD CONFIDENCE BEFORE SET ONE

Training intent, duration, and exercise order explain the session before the user commits.

CONSUMER REFERENCE

1

Lead with intent

A short guidance card explains how to approach the workout today.

2

Use readable hierarchy

Exercise, prescription, and working load scan as one row.

3

Current exercise is explicit

Blue plus numbering communicates order without color alone.

4

Bottom action is stable

Begin workout stays above the safe area and never covers content.

ACCEPTANCE

Long exercise names wrap cleanly. Working-weight units stay attached to their values. The bottom dock remains visible at large text sizes.

ACTIVE SET: NO HUNTING UNDER LOAD

Load, reps, prior performance, and completion live in a stable one-handed layout.

CONSUMER REFERENCE

1

Context in one header

Exercise position, title, and elapsed time form one compact status area.

2

Value and controls stay bound

Minus and plus always change the visible load and state the increment.

3

Prior set is a ledger

A compact row confirms what happened without competing with the current set.

4

RPE comes after logging

Prompt for effort after completion so load and reps stay dominant before the set.

ACCEPTANCE

Controls provide at least 44 px targets, editable values use 16 px text or larger, and Log set remains reachable with the keyboard open.

REST: LOWER THE COGNITIVE LOAD

The timer dominates while the next set stays visible enough to prepare.

CONSUMER REFERENCE

1 Time owns the screen

No competing charts, cards, or messages appear during the countdown.

3 Adjustments are secondary

Time chips are compact and cannot compete with the primary action.

2 Next set stays visible

Exercise, load, reps, and intent remain below the timer.

4 Lime confirms completion

The previous set uses lime; the live countdown and actions remain blue.

ACCEPTANCE

Rest works without motion, provides text for the remaining time, and prevents accidental skipping through clear spacing and button priority.

COMPLETE: CELEBRATE THE EVIDENCE

A restrained completion moment recognizes the session and surfaces one meaningful improvement.

CONSUMER REFERENCE

1

Celebrate once, then settle

Use a brief tactile/visual response and a stable final screen.

2

Summarize what happened

Duration, volume, and completed sets are clear and comparable.

3

Highlight one real win

Show a PR or load increase only when supported by session data.

4

Collect useful reflection

Effort and notes support future programming without blocking Done.

ACCEPTANCE

Done persists the session and returns to Today. Edit and note actions remain available without threatening the completion state.

PROGRESS: FINDING FIRST, CHART SECOND

The screen explains what changed, names the baseline, and uses the chart as proof.

CONSUMER REFERENCE

1

Name the comparison

The insight states 11% versus the previous 8-week block.

2

Color has data meaning

Neutral history, blue current period, lime goal or PR.

3

Label units and periods

Volume and time controls appear before the chart.

4

Records open history

Each record carries date, value type, and a path to exercise detail.

ACCEPTANCE

Every chart includes an accessible text summary, units, and the selected comparison period. No conclusion depends on color alone.

COACH: FOCUSED HELP, NOT AN EMPTY CHATBOT

A small number of meaningful starts make Coach feel grounded in the user's programme.

CONSUMER REFERENCE

1

One quick-start pattern

Goal chips replace duplicated suggestion lists.

2

Context stays relevant

Recent insight connects the conversation to real training history.

3

Privacy is visible

Explain on-device history and the user-provided API key near the composer.

4

Composer respects the device

Image input, send, keyboard, and safe area work together.

ACCEPTANCE

Coach retains chat history, image input, intake, and non-streaming behavior. Missing-key, offline, loading, and failure states are explicitly designed.

COACH CHANGES: SAFE, SPECIFIC, REVERSIBLE

The user sees the caution, proposed diff, reason, scope, and reversal path before anything changes.

CONSUMER REFERENCE

1

Surface training risk

Pain and injury language receives a distinct conservative caution state.

2

Show before and after

Load, exercise, and prescription changes are visible in a compact diff.

3

Explain the reason

Coach connects every edit to the user's request and affected sessions.

4

Preserve reversal

Undo and Restore previous programme remain available after application.

ACCEPTANCE

Nothing silently rewrites the routine. Apply today and Keep plan are separate, unambiguous controls, and the change is written to visible history.

PROGRAMME: THE WEEK IS THE PRODUCT

Open on the current schedule, then let exercise detail and the library become drill-down views.

CONSUMER REFERENCE

1

Current week leads

Week 6 and completion status answer orientation immediately.

2

Day states are explicit

Done and Up next use text, icons, shape, and color together.

3

Change history is visible

Show when Coach or the user last changed the programme.

4

Editing has a clear route

Edit with Coach is the single high-emphasis action.

ACCEPTANCE

The routine remains the existing kt_routine data model. Restore previous programme continues using the current backup behavior.

SETTINGS: A TRUST CENTER, NOT A MENU DUMP

Rows are grouped by user intent and connection states explain exactly what is stored or imported.

CONSUMER REFERENCE

1

Group by intent

Preferences, Training plan, Connections, and Data + privacy.

2

Connection state is clear

Apple Health and Coach show scope, readiness, and last sync.

3

Privacy copy stays plain

Say what remains on-device without adding claims or legal noise.

4

Danger stays separate

Reset and delete actions use a clearly isolated confirmation flow.

ACCEPTANCE

Every settings row has one destination or action. Apple Health remains read-only and imports running workouts only in the native iOS shell.

RUN LOGGING AND PROGRAMME INTAKE

Secondary flows inherit the same type, cards, action hierarchy, and trust language.

RUN LOG

7:12

Log a run

OUTDOOR RUN

MORNING MILES.

Distance mi 3.10 mi

Duration hh:mm:ss 27:42

Average pace Calculated 8:56 /mi

Import from Apple Health
Supero reads running workouts only and never writes health data.

How did it feel?

Easy Steady Hard

Save run

STARTER INTAKE

9:41

Build your programme 3 of 10

YOUR TRAINING WEEK

How many days can you train consistently?

Choose the schedule you can keep on a busy week. Coach will build around it.

2 days

3 days

4 days

5 days

6 days

Why this matters
A realistic schedule produces better exercise spacing, recovery, and adherence.

Continue →

1 Lead with the task

Run prioritizes distance, duration, and pace. Intake asks one question per step.

2 Explain source and scope

Health import states runs only and read-only access.

3 Keep input confidence high

Large fields, named units, visible selection, and one Save/Continue action.

4 Design failure states

Invalid values, denied permission, and interrupted intake explain the next step.

MOTION, ACCESSIBILITY, AND SYSTEM STATES

Consumer polish is most visible when the happy path is interrupted.

MOTION

- 120 ms tap response
- 220 ms state change
- 320 ms sheet
- No looping decoration
- Honor reduced motion

Design and verify these states before declaring a screen complete.

ACCESSIBILITY

- 44 px tap targets
- AA body contrast
- Selection is not color-only
- Charts include text summaries
- Large text reflows

Design and verify these states before declaring a screen complete.

SYSTEM STATES

- Empty programme
- Coach key missing
- Offline API error
- Keyboard open
- Import partial failure

Design and verify these states before declaring a screen complete.

IMPLEMENT THE SYSTEM, THEN THE SCREENS

The package is designed to be read before any app code is changed.

1

Read the brief

Use CLAUDE-DESIGN-BRIEF.md as the behavioral contract.

2

Load the tokens

Map supero-design-tokens.json into shared CSS variables.

3

Build primitives

Header, nav, buttons, cards, fields, status, action dock.

4

Ship by flow

Core workout loop first, then progress, Coach, and system views.

NON-NEGOTIABLE

- Preserve all localStorage data and existing behavior.
- Keep the four-tab information architecture.
- Do not remove the iOS keyboard scroll guard.
- Keep Coach changes previewed and reversible.
- Bump the build stamp and run ./verify.sh.
- Compare every implemented state against screens/.
