

SUPERO

# HEAVY WEIGHT

V2

A clearer, calmer design  
direction for the training  
app.

## DESIGN ARTIFACT ONLY

No app code, behavior, or stored data is  
changed by this document.

## REFINED DIRECTION

# TRAIN HARD. READ EASY.

Keep the bold editorial character. Make every screen answer three questions immediately:  
where am I, what matters now, and what do I do next?

### ONE PRIMARY ACTION

A single blue action per screen. Secondary  
controls stay quiet.

### OUTCOME, NOT ACTION

Lime confirms completion, progress, PRs,  
and positive status.

### PROOF BEFORE DECORATION

Data, timing, and labels explain the screen  
before visual flourish.

### CALM UNDER EFFORT

Large targets, restrained motion, and stable  
layouts support training focus.

**Original concept refined into a production-ready visual specification.**

Prepared 28 Aug 2026

# A STRICTER VISUAL SYSTEM

The personality stays loud. The interface becomes more predictable and accessible.

## COLOR HAS A JOB

**INK****#0C0D0D**

Content and structure

**ACTION****#1249F5**

Tap, current, focus

**OUTCOME****#91D400**

Done, PR, progress

**PAPER****#F7F5EF**

Default canvas

**RISK****#D33E32**

Pain, delete, warning

## TYPE + RHYTHM

**TODAY**

Display / 44-56 pt / uppercase

**Push A**

Section / 20-24 pt / sentence case

### 4 PT BASE GRID

**8****16****24****32**

tight

related

section

screen

Cards use 16-20 pt internal spacing. Screen edges use 24 pt. Tap targets never drop below 44 pt.

# TODAY: FASTER ORIENTATION

The start screen should feel confident at a glance, not crowded before the first set.

## REFINE, DO NOT REINVENT

- 1 Reduce the poster tax**  
Keep the editorial title, but trim its height so the workout and first progress signal land above the fold.
- 2 Make one action dominant**  
The blue Start session button is the only CTA. Remove the competing lime arrow from the same card.
- 3 Turn summary into guidance**  
Replace decorative stats with one anchored insight: 3 of 4 sessions, plus the next best action.
- 4 Stabilize the navigation**  
Use icon plus label, preserve the iPhone safe area, and show selection with shape and weight as well as color.

# ACTIVE SET: TRAIN WITHOUT HUNTING

The lifter is under load. Every control must be reachable, obvious, and stable.

## EFFORT-FIRST CONTROLS

- 1 Compress session context**  
Exercise, set, and timer should read as one compact status row instead of three competing headlines.
- 2 Bind controls to the value**  
Attach minus and plus to the load field and label the increment. Prevent accidental 5 lb jumps.
- 3 Separate reps from effort**  
Keep reps editable before logging. Ask for RPE immediately after the set, when the answer is more accurate.
- 4 Keep completion thumb-close**  
Fix Log set above the safe area. Show Current 2 of 4 in text, not only in the progress rail.

# REST: RECOVERY WITH DIRECTION

Rest should lower cognitive load while keeping the next set and timing unmistakable.

## CALM, THEN PREPARE

### 1 Countdown owns the screen

Center the remaining time and reduce surrounding chrome. Time is the only urgent information here.

### 2 Show what comes next

Keep load, reps, and exercise visible below the timer so the athlete can prepare without leaving rest mode.

### 3 Quiet the adjustments

Use compact +15 and -15 chips. Skip rest stays secondary and cannot be tapped by mistake.

### 4 Use lime as recovery status

Reserve lime for Rest complete or Ready. The active countdown and controls remain blue.

# PROGRESS: EXPLAIN THE RESULT

Charts should prove a finding. They should not ask the user to discover the story alone.

## FINDING FIRST, CHART SECOND

- 1 Anchor every claim**  
Say Volume is up 11% vs the previous 8-week block. Comparisons need a named baseline.
- 2 Neutral history, blue now**  
Past bars become neutral ink tints. Blue marks the current period. Lime appears only for a PR or goal hit.
- 3 Add metric controls**  
Provide Volume, Sessions, Strength and a clear 4W / 8W / 12W period switch before the chart.
- 4 Make records actionable**  
Each record row opens its exercise history and shows date, delta, and whether the value is estimated.

# COACH: USEFUL, SAFE, REVERSIBLE

The AI should feel like a focused training tool, not an unlimited chat surface.

## COACH HOME

## PLAN CHANGE

1

### Choose one entry pattern

Use goal chips for quick starts and remove the duplicate list of suggested questions below.

2

### Set the safety boundary

Pain, dizziness, and injury prompts get a distinct caution state before advice is generated.

3

### Preview programme edits

Show Before and After, the reason, and affected days. Nothing silently rewrites the plan.

4

### Make reversal permanent

Keep Undo and Restore previous plan visible in the change history, not only in a transient toast.

# SETTINGS + PROGRAMME: REDUCE THE MAZE

The supporting screens should feel like a quiet control panel for the training experience.

## SETTINGS

## PROGRAMME

1

### Group by user intent

Use Preferences, Training plan, Connections, and Data + privacy. Avoid a long undifferentiated card stack.

2

### Expose connection state

Apple Health and Coach show Connected, Last sync, and the exact data scope before any action.

3

### Lead with the week

Programme opens on the weekly schedule. Exercise detail and library become drill-down views.

4

### Isolate destructive actions

Reset and delete controls live in a clearly labeled danger zone with confirmation and recovery language.

# ONE COHERENT PRODUCT

Apply the same hierarchy rules to every view before adding new decoration.

## CORE LOOP
